SUMMARY

Front-End Engineer with ~4 years of experience building Shopify embedded applications for global merchants, from fresher to Middle Engineer. Contributed to rebuilding a production client codebase from legacy JavaScript to strict TypeScript and React 18, and helped execute a Feature-Driven → Layered Architecture restructuring across a multi-app Turborepo monorepo, removing duplication across 40+ shared UI components. Comfortable owning features end-to-end — from API integration and state management to CI/CD debugging — and designed the loader architecture for an 8-language i18n system and the public interface for an internally published NPM package used by two product teams.

TECHNICAL SKILLS

Core	HTML5, CSS3, TypeScript (Strict Mode), JavaScript (ES6+), React
Architecture	Monorepo (Turborepo), Layered Architecture, Feature-Driven Architecture, Component-Driven Development
State & data	TanStack React Query, Zustand, Redux Toolkit, REST, GraphQL (Shopify Admin & Storefront APIs)
Build & performance	Vite, SWC, code splitting, bundle chunk analysis, Web Vitals (LCP, CLS, INP, FCP)
UI & styling	Responsive Design, Cross-browser Compatibility, Shopify Polaris, Polaris Viz, Tailwind CSS, SCSS Modules, styled-components, Figma
Integrations	Real-time WebSockets (Pusher), Formik / React Hook Form + Yup, i18next (multi-locale)
DevOps & tooling	Git, GitLab CI/CD, Docker, internal NPM package publishing
AI-augmented development	GitHub Copilot, Claude — prompt engineering for refactoring and debugging
Familiar with	Next.js (App Router / SSR fundamentals)

EXPERIENCE

FireGroup — Middle Front-End Engineer

Oct 2022 — Aug 2026 · Ho Chi Minh

Oneloyalty — Loyalty & Rewards Suite

Jun 2024 — Aug 2026

Shopify embedded app · apps.shopify.com/oneloyalty

- Contributed to architecting a multi-app Turborepo monorepo unifying Shopify Admin apps, Storefront extensions, and shared packages (packages/i18n, packages/ui), eliminating cross-repo code duplication.
- Drove the migration to Layered Architecture for the features and shared layers I owned — UI, i18n, Rewards, Settings, Campaign, and Gamification; removed circular and cross-feature dependencies (e.g. lifting shared reward types out of the Rewards feature into a neutral shared layer) and eliminated duplication across **40+ shared UI components**.
- Designed and implemented a dependency-injection loader architecture for an 8-language i18n system (packages/i18n), letting each app (Admin, Storefront) supply its own runtime translation source without changing the core package.
- Integrated Shopify Admin & Storefront GraphQL APIs alongside REST endpoints using TanStack React Query v5.
- Diagnosed and resolved GitLab CI/Docker pipeline failures (Node version mismatches, unintended nested npm install triggered by a prepare hook), keeping the monorepo's CI/CD stable at a **5-10 minute** build time.
- Used AI-assisted tools (GitHub Copilot, Claude) to speed up TypeScript refactors and debugging in daily feature delivery.

Swift — SEO & Speed Suite

Oct 2022 — Jun 2024

Shopify embedded app · apps.shopify.com/swift

- Rebuilt the core client architecture from legacy JavaScript to strict TypeScript and React 18, working with a Senior Engineer to overhaul state management and the data layer.
- Cut ~4s off initial load via route-based code splitting and vendor chunking; later collaborated with a Senior Engineer on the migration to App Bridge 2.0 session tokens, bringing total load from ~12-13s to ~1-2s.
- Designed and published an internal NPM package for store speed-auditing using an inversion-of-control pattern (host app supplies callbacks; React/UI libraries kept as peer dependencies), so two separate teams could adopt it independently.
- Built UI for theme speed optimization (JS/CSS minification, image lazy-loading, HTML cleanup) and SEO tooling (alt-text automation, meta tags, structured snippets, sitemaps).

PERSONAL PROJECT

SafeBulk — Shopify Bulk Product Editor

Jul 2026 — Present

Side project, team of 2 · Sole Frontend Developer

GitHub: github.com/nguyenthanhdat22012001/safe-bulk-shopify

Demo: loom.com/share/6c30f307347d4555b0214ff8be0ab84f

React 19, TypeScript (strict), TanStack Router + Query, Zustand, GraphQL (Shopify Admin API), Docker, GitHub Actions

- Built and own the entire frontend solo, working with 1 backend engineer on API contracts (wrote design specs before each feature to reduce rework).
- Designed a 3-step Bulk Edit Wizard (filter → configure rules → preview with per-row severity) and a resumable CSV import/export flow with validation preview.
- Handled long-running backend jobs via React Query conditional polling, syncing job state to the URL for shareable, resumable links.
- Built plan-gating/paywall logic across 4 tiers, including handling a race condition where a quota-limit error can return mid-job.
- ~12.6k lines of TypeScript, 520+ **118n** keys, no any; deployed via multi-stage Docker + GitHub Actions CI.

EDUCATION

FPT Polytechnic College

09/2020 — 01/2022

Website Design. Graduated with Honors, GPA 8.1/10.
